

ABSTRACT

A first video receiver is controlled to interrupt live watching of a television broadcast program; and thereafter, a second video receiver installed in another location can be controlled to continue display of the program from the interrupted point in the program. There is a digital video recorder server that is capable of communication between local and remote sets via a home network. When a move watching and listening function is commanded at the local set, a built-in digital video recorder starts recording the program in progress. When a command is received at the local set for shifting the watching of the program to the remote set thereafter, the local set reads the recorded program from the recording start point and delivers it to the remote set from the server for effecting time shift watching and listening to the program on the remote set.
